Detections

US imports ~ 40 million tons
of agricultural products

Only 2% inspected:
> 39 million tons uninspected

Plus:
Tourism, immigration, weather

The Plant Disease and Insect Clinic (PDIC) at NC State University

The Plant Disease and Insect Clinic (PDIC) at North Carolina State University promotes and safeguards plant health by:

- Diagnosing plant disease and insect problems
- Reporting results to clients, regulatory agencies, and National Plant Diagnostic Network
- Educating clientele, students and professionals about plant diseases, insect pests and diagnostic methods
- Training first responders to recognize and diagnose plant diseases and insects

Who is our clientele?

Commercial greenhouse and nursery operators
Farmers Landscape managers Golf Industry
Pest control operators

Who is our clientele?

Homeowners General public
Research community Public gardens
Public schools NC DOT
Municipalities
Medical and veterinary providers

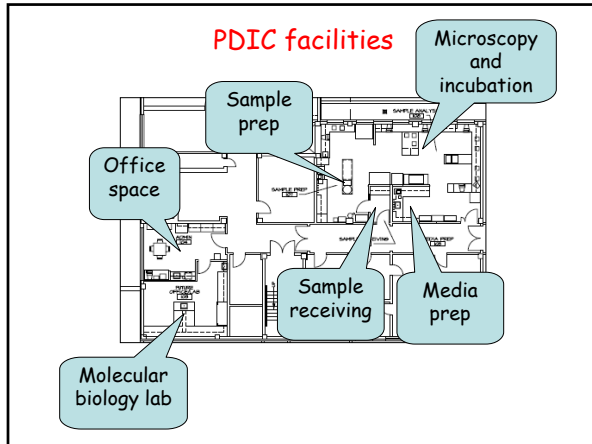

Diagnose/Identify

Plant diseases and disorders
Insects and insect damage
Household molds and wood decay
Mushrooms and other macrofungi

Weeds - CS, HS, Plant Biology
Injuries and disorders - CS, HS
Ethylene analysis - HS

Nematode assay and identification -
NCDA&CS
Soil analysis - NCDA&CS
Tissue analysis - NCDA&CS

PDIC facilities

APHIS permit to accept out-of-state disease samples - biosafety cabinet, etc.

Molecular biology lab - realtime and conventional PCR, Biolog

Microscopes with cameras

Lab computers are networked

Electronic sample submission

www.cals.ncsu.edu/plantpath/extension/clinic/Submit/submit.htm

County agents have accounts

Public can create accounts

Online form

Accepts large images

Electronic reporting

International digital image submission

Forms and instructions

Instructions in Spanish
in large, printable
format

NC STATE UNIVERSITY

Plant Disease and Insect Clinic at North Carolina State University
Cómo tomar, empaquetar, y enviar muestras de plantas de invernadero para el diagnóstico de enfermedades.

-1-

Seleccionar varias (de 3 a 5) plantas sintomáticas. Se puede incluir también una planta sana como referencia.
Envolver las raíces con todo el suelo en papel celofán o en una bolsa de plástico.

Sample Quality: Packaging & Shipping

- Keep soil on roots
- No extra water
- Wrap in dry paper then double bag in plastic
- Disinfect exterior of bags
- Strong crush-proof box, tape all seams

Digital imaging for diagnosis

Tobacco: Blue Mold

Images show the problem in context

PDIC staff and organization

PDIC Staff

- Budgets
- Grants and funding
- Policy and priorities
- Participation in NPDN/SPDN
- Outreach and extension
- Graduate education
- Supervise professional staff

Sample results

Date Entered: 2010-01-21
 Pest: Leaf Spot (Pseudocercospora kurimensis)

Findings: FOLLOW-UP REPORT 28-JAN-2010

For management of leaf spots caused by *Cercospora* and related fungi, keep leaf wetness to a minimum, don't let diseased fallen leaves accumulate, and maintain a fungicide spray schedule to prevent new infections. Materials good for controlling *Cercospora* include Heritage, Daconil ultrax, Eagle, and Insignia. Be sure to try any new fungicides on a small set of plants first, to be sure you do not cause burn.

This particular leaf-spotting fungus will only infect Nerium, so it's not a threat to other plants you may be growing.

The root assays for *Phytophthora* were NEGATIVE.

Mike Munster and Kelly Ivors

 PRELIMINARY REPORT 21-JAN-2010

One 3-gal oleander plant submitted. Numerous chlorotic to necrotic angular leaf spots on older leaves. Spots were negative for bacterial streaming. They were also negative for foliar nematodes, even after cut-up leaves were soaked in water for 3 hours. Our entomologist found no sign of insects or mites.

On the underside of the leaf spots a fungus was sporulating that perfectly fits the description of *Cercospora nerii*-india, now known as *Pseudocercospora kurimensis*. Symptoms also coincide with those caused by this fungus. As far as I know, this is the first report of this fungus in North Carolina.

Roots mostly looked good, but a few were decayed and are being assayed, so as to be thorough. These results will be ready by next week. We will then send a complete report with control recommendations. If you have immediate questions about control, please contact Dr. Kelly Ivors at kelly_ivors@ncsu.edu.

Potting mix had a pH of 4.6 and an EC of 0.22 mS/cm, with the 2:1 method.

Please note: soil was spilled en route and form & check were soiled. Please wrap a plastic bag around the pot/root ball to reduce spillage of potting mix. Thank you.

Mike Munster

PDIC database

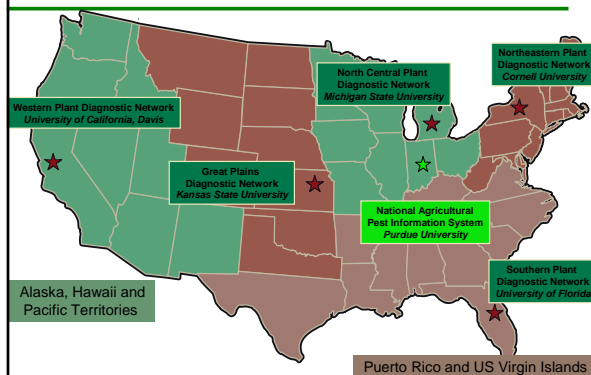

- Allows on-line entry of sample information
- Each sample is uniquely identified
- Electronic access to clinic records
- Reports
 - Individual samples
- Database is searchable by many criteria
 - host genus/species/code
 - pathogen genus/species/code
 - location, date, year, client
- Correspondence part of permanent record

Reporting

- Regulatory agencies are notified in the event of finds of regulatory significance
- Database coordinates with NPDN
- NPDN is notified of new records

NPDN

Pests of regulatory significance 2009

Chrysanthemum white rust *Puccinia horiana*
 Brown marmorated stink bug *Halyomorpha halys*
P. ramorum
 NCDA surveys, does preliminary ELISA
 PDIC isolates DNA
 ID is done in Beltsville
 We have not received any positive samples directly from the public
R. solanacearum
 not race 3 biovar 2

PDIC Sample submission page
www.plantclinic.ces.ncsu.edu

- Features:
- County agents check in samples
 - Public can create accounts
 - Fill out form online
 - Larger images accepted
 - Check your reports anytime
 - See www.ncsu.edu/pdic for details

Why do we ask for so much information?

- Complete and accurate information improves the quality of the diagnosis
- You are our eyes on-site
- Helps us determine if the sample fits your observations
- Diagnosis can be made more quickly
- Allows us to have a complete record of trends or new diseases and insects

Contact information

The screenshot shows a web form titled "Sample Entry" with the following sections:

- Sample Entry:** Sample Number (N/A), Date Entered (Today), Status (NEW).
- CONTACTS:** Who is responsible for the sample? Fields for Client, Agent, Consultant, and Other, each with a "Send Invoice To" checkbox and a "Learn more about sample fees" link.
- LOCATION:** Where did you find the sample? Fields for Host Site Type (Home grounds) and Host Address (Same as the Client).
- GENERAL:** (Partially visible at the bottom).

80	Between Veins

An important clue for diagnosis

Usually diseases do not affect 100% of the area

Tells us how serious the problem is

Disease information - Area affected

For multiple plants (field, bed, nursery)

Examples:

Number affected/total number of plants

Percent area affected

(e.g. 20 sq ft in a 10 X 10 bed = 20%)

Estimate by pacing off a set area and counting

Disease information - Part affected

Disease information - Distribution

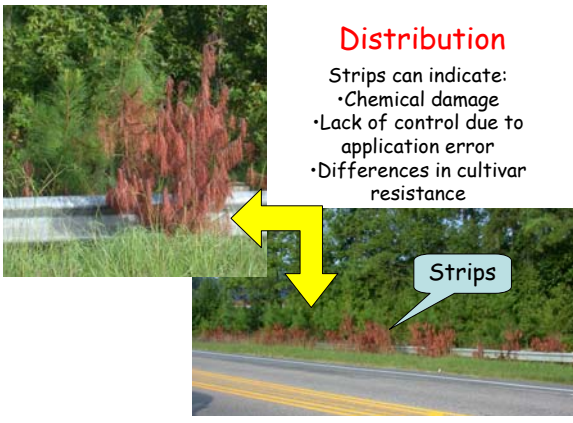

Disease Information - Distribution

Distribution

Strips can indicate:

- Chemical damage
- Lack of control due to application error
- Differences in cultivar resistance
